# Interim Target Achieved and New Interim Target Established for Tokio Marine Group's Support of the Transition to a Decarbonized Society

Tokio Marine Holdings, Inc. (President and Group CEO: Masahiro Koike) has established a new interim target for FY2030 to further advance Tokio Marine Group's support for the transition to a decarbonized society.

## 1. Interim target achieved

Tokio Marine Group considers climate change a top-priority issue that requires a global response. To achieve net zero by 2050, the Group is working to reduce $CO_2$ emissions from our own operations and provide insurance products and solutions that support our customers and society in the transition toward decarbonization.

To further advance these efforts and support the transition of customers and society toward decarbonization, in September 2024, the Group set an interim target of JPY 45.0 billion in decarbonization-related insurance premiums[*1] by the end of FY2026.[*2]

Since then, underwriting for clean energy-related projects has expanded, led by Tokio Marine GX (TMGX).[*3] As a result, decarbonization-related insurance premiums reached JPY 55.5 billion in FY2025, achieving the FY2026 target one year ahead of schedule.

*1 Definition of decarbonization-related insurance premiums: Premiums generated from insurance products that directly contribute to the realization of a decarbonized society, including insurance for renewable energy businesses such as offshore wind and solar power generation (e.g., Construction/Engineering, Property, Liability, Business Income, Marine/Cargo Insurance), extended warranty insurance for electric vehicles and storage batteries, and Warranty and Indemnity (W&I) insurance for acquisition and transfer of renewable energy businesses.

## 2. New interim target for FY2030

A key role for Tokio Marine Group in supporting the transition to a decarbonized society is to leverage the risk expertise and underwriting capabilities it has cultivated over many years to better support customers' new challenges. To further fulfill this role, the Group has established a new interim target of **JPY 100 billion in decarbonization-related insurance premiums by the end of FY2030.**

## 3. Looking ahead

As Tokio Marine Group pursues our new interim target for 2030, we will continue to leverage the risk expertise and underwriting capabilities cultivated through our domestic and international operations to support the transition toward decarbonization for our customers and society. We will do so by providing solutions and insurance products designed to analyze and mitigate the risks associated with emerging technologies and infrastructure.

Achieving net zero by 2050 will require the continued expansion of renewable and next-generation energy, supported by growing investment in new technologies and infrastructure. Advancing the transition across society will also require an environment in which decarbonization technologies and related infrastructure can be introduced and operated safely and reliably.

Through our efforts toward achieving the FY2030 target, Tokio Marine Group will help create such an environment and encourage customers' decarbonization initiatives, thereby contributing to the realization of net zero by 2050.

For further details on Tokio Marine Group’s overall approach to supporting the transition, please refer to the Climate & Nature Report 2026, published today in Japanese on our website (English version to follow by the end of September).
